LIST OF CURRENT CLAIMS

1-15 (Canceled)

16. (Currently Amended) A portable data carrier capable of authentication by

means of biometric data, comprising a memory in which at least two sets of biometric

reference data each belonging to a different system for biometric authentication are stored,

and wherein the different sets of reference data are generated from biometric data of one

and the same biometric feature using different algorithms, and wherein each of the sets of

biometric reference data includes an identification which designates the algorithm used for

generating the set of reference data.

17. (Currently Amended) A terminal for authentication by means of biometric data

comprising a sensor arranged to detect a biometric feature, an I/O device for transferring

data, and a control and data processing unit which is arranged to convert biometric data

from the sensor which were derived from one and the same detected biometric feature into

comparative data by an algorithm, wherein at least two different algorithms are used to

convert said biometric data from the sensor into said comparative data, each of said

different algorithms belonging to a different system for biometric authentication, said

comparative data including an identification which designates the algorithm used for

generating the comparative data.

18. (Currently Amended) A biometric authentication device comprising:

a portable data carrier capable of authentication by means of biometric data

comprising a memory in which at least two sets of biometric reference data are stored each

belonging to a different system for biometic authentication, and wherein the different sets

of reference data are generated from biometric data of one and the same biometric feature

Examiner: Hadi AKHAVANNIK

using different algorithms, and wherein each of the sets of biometric reference data

includes an identification which designates the algorithm used for generating the set of

reference data;

a terminal for authentication by means of biometric data comprising a sensor

arranged to detect at least one biometric feature, an I/O device for transferring data, and a

control and data processing unit which is arranged to convert biometric data from the

sensor which were derived from one and the same detected biometric feature into

comparative data by an algorithm, wherein at least two different algorithms are used to

convert said biometric data from the sensor into comparative data;

wherein said reference data are transferred by the I/O device from the data carrier

to the terminal, and

wherein the control and data processing unit are arranged to check the reference

data for a match with the comparative data.

19. (Previously Presented) The authentication device according to claim 18,

wherein the comparative data are transferred by the I/O device from the terminal to the

data carrier; and

the data carrier includes a control and data processing unit arranged to check the

reference data for a match with the comparative data.

20. (Previously Presented) The authentication device according to claim 18,

wherein the portable data carrier is a smart card.

21. (Previously Presented) The authentication device according to claim 18,

wherein the sets of reference data and the algorithms used for generating the sets of

comparative data have a characteristic identification, and wherein reference data and

comparative data with the same identification are checked.

Art Unit: 2621

22. (Previously Presented) The authentication device according to claim 18,

wherein the detected biometric feature is selected from the group consisting of iris, retina,

face, speech, fingerprints and a signature including the writing dynamics determined

during signing.

23. (Previously Presented) A method for authentication by means of biometric

data comprising the steps:

deriving and storing several sets of reference data from biometric data of one and

the same detected biometric feature using different algorithms each belonging to a

different system for biometic authentication, wherein each of the sets of biometric

reference data includes an identification which designates the algorithm used for

generating the set of reference data;

detecting biometric data;

converting the detected biometric data into comparative data by an algorithm; and

comparing the stored reference data with the converted comparative data for an

authentication.

24. (Previously Presented) The method according to claim 23, wherein the step of

converting detected biometric data into comparative data is carried out by using at least

two different algorithms.

25. (Previously Presented) The method according to claim 23, wherein the

reference data and/or comparative data or the algorithms generating them have an

identification, and only the stored reference data are compared with converted

comparative data which have the same identification or only comparative data are

Examiner: Hadi AKHAVANNIK

Art Unit: 2621

converted from the detected biometric data by the algorithm which has the same

identification.

26. (Previously Presented) The method according to claim 23, wherein the

detected biometric feature is selected from the group consisting of iris, retina, face, speech,

fingerprints and a signature including the writing dynamics determined during signing.

27. (Previously Presented) The method according to claim 23, wherein several

different sets of reference data are derived and stored, and several different sets of

comparative data have been converted from detected biometric data, and wherein the

several different sets of reference data are compared with the several different sets of

comparative data for authentication.

28. (Previously Presented) The method according to claim 27, wherein the

different sets of reference data and the different sets of comparative data are derived and

converted from biometric data of the same kind which have been converted by different

algorithms.

29. (Previously Presented) The method according to claim 27, wherein the

conversion of the different sets of reference data and comparative data starts out from

different biometric data which have been converted by the same or by different

algorithms.

30. (Previously Presented) The method according to claim 27, wherein upon

comparison of several different sets of reference data with several different sets of

comparative data, the authentication is decided positively if the majority of comparisons

are positive.

Art Unit: 2621

31. (Previously Presented) A terminal according to claim 17, wherein the detected biometric feature is selected from the group consisting of iris, retina, face, speech, fingerprints and a signature including the writing dynamics determined during signing.

- 32. (Previously Presented) A portable data carrier according to claim 16, wherein the portable data carrier is a smart card.
- 33. (Previously Presented) A portable data carrier according to claim 16, wherein the detected biometric feature is selected from the group consisting of iris, retina, face, speech, fingerprints and a signature including the writing dynamics determined during signing.
